

Software Requirements Specification (SRS) for the Training Management System (TMS).

1. Who created the final version?

The final version (Version 1.0) of the SRS document was finalized on December 31, 2002.

2. What is the intended use?

“To automate, acquire, and track training and testing sessions for Government of Jordan (GoJ) employees. The system will support a bidding process for training/testing offers and will have the ability to track employees’ training/testing nomination, registration, and results. The system will accept course feedback from the trainees. Relevant reports and views are to be generated also as part of this system.”

3. Who are the intended users?

The intended user is defined in the SRS as “actors”.

An actor is anything that exchanges data with the system. An actor can be a user, external hardware, or another system. The following are identified actors on the system.

- **System Administrator:** Sets up and maintains system control data (entities, locations, users).
- **PMU Administrator (Project Management Unit):** Manages the entire training/testing workflow, vendor selection, and registration.
- **TP Administrator (Training/Testing Provider):** Submits offers, maintains center details, and tracks attendance/results.
- **Training Coordinator (TC):** Represents specific GoJ entities to track and nominate employees for training or testing.
- **GoJ Employee:** Individual trainees who can log in using their National ID to track their history and fill out evaluations.

4. What is the standard environment?

The standard environment is specified as follows:

- **Application Type:** Web-based (accessible via Internet or Intranet).
- **Web Browser:** Microsoft Internet Explorer 5.0 or above.
- **Optimal Screen Resolution:** 800 x 600 pixels.
- **Languages:** English and Arabic (English for administrative roles; Arabic for trainees).
- **External Integration:** Microsoft Excel 2000 or above for report exports.

5. Selection and Analysis of a Functional Requirement

Selected Requirement: FR19.4 RFI Response Attachment * *Description:* "RFI Response must have the ability to attach a binary file of 2 MB maximum size".

Evaluation Against Quality Criteria:

- **Complete: Yes.** It defines the action (attaching a file), the file type structure (binary file), and a measurable operational boundary (2 MB maximum size).
- **Accurate: Yes.** The exception flow **E-4** described in Use Case 4.3.14 handles the scenario where total attachments exceed 2 MB.
- **Unambiguous: Yes.** The limitation "2 MB maximum size" is quantifiable, and cannot be interpreted in multiple ways.
- **Traceable: Yes.** It maps to Use Case 4.3.14 (*RFI Response Maintenance*) and corresponds to the component description in the Appendix under "*RFI Response Attachments*".
- **Testable: Yes.** Can be easily tested by trying to upload a file of 1.9 MB (expected pass) and another file of 2.1 MB (expected failure with error message E-4).

6. Is there a requirement regarding data security? If yes, how does that look like?

Yes. Security requirements are defined via structural role-based access control policies:

Requirement No.	User Group	Access Control & Security Level PDF
SEC01	PMU	Full control over the entire system, system control configurations, lookup data, and comprehensive reporting.
SEC02	TP Administrators	Restricted power; restricted to updating center info, attendance logs, grades, and submitting offers.
SEC03	Training Coordinators	Restricted power; restricted to managing and nominating employees within their own specific GoJ entity.
SEC04	GoJ Employees	Lowest privilege level; read-only access to personal history and write access strictly for course evaluation forms.

7. Is there a requirement on how the software should be designed? If yes, what does that look like?

Yes. Under architectural design constraints (Section 3 and **SYS03**), the design requirements dictate that:

- The application must utilize a **3-tier software architecture**.
- It must feature native **XML support** to guarantee backend interoperability with future e-Government ecosystem applications.

The breakdown of this architecture is as follows:

1. **Tier 1 (Front-End):** High-level, browser-based user interface.
2. **Tier 2 (Middleware):** Distributed, object-based, scalable components comprising the Web Server, Object Broker, and Resource Manager.
3. **Tier 3 (Back-End):** Core back-end resources and data services.
